## The zeta function of p 4 counting normal subgroups

## 1 Presentation

p4 has presentation

$$
\left\langle x, y, r \mid[x, y], r^{4}, y^{r}=x^{-1}, x^{r}=y\right\rangle .
$$

## 2 The zeta function itself

The zeta function was calculated by du Sautoy, McDermott and Smith. It is

$$
\zeta_{\mathbf{p} 4}^{\triangleleft}(s)=1+3 \cdot 2^{-s}+2 \cdot 4^{-s}+2 \cdot 8^{-s}+4^{-s} \zeta(s) L\left(s, \chi_{4}\right) .
$$

## 3 Abscissa of convergence and order of pole

The abscissa of convergence of $\zeta_{\mathbf{p} 4}^{\triangleleft}(s)$ is 1 , with a simple pole at $s=1$. Since this group is a finite extension of a free abelian group, its zeta function has meromorphic continuation to $\mathbb{C}$.
